sites and/or variations in gene copy number in an individual. The methods are particularly useful for anal. of biotransformation genes, such as

cytochromes P 450. The invention provides arrays of immobilized probes, and methods employing the arrays, for detecting mutations in the biotransformation genes, such as cytochromes P 450. For example, one such array comprises four probe sets. A first probe set comprises a plurality of probes spanning a polymorphic site, each probe comprising a segment of at least six nucleotides exactly complementary to a subsequence of a polymorphic form at the site from a biotransformation gene, the segment including at least one interrogation position complementary to a corresponding nucleotide in the polymorphic form. Second, third and fourth probe sets each comprise a corresponding probe for each probe in the first probe set. The probes in the second , third and fourth probe sets are identical to a sequence comprising the corresponding probe from the first probe set or a subsequence of at least six nucleotides thereof that includes at least one interrogation position, except that the at least one interrogation position is occupied by a different nucleotide in each of the four corresponding probes from the four probe sets. AB

The invention provides methods of monitoring expression levels of different polymorphic forms of a gene. Such methods entail analyzing genomic DNA from an individual to determine the presence of heterozygous polymorphic forms at a polymorphic site within a transcribed sequence of a gene of interest. RNA from a tissue of the individual in which the gene is expressed is then analyzed to determine relative proportions of polymorphic forms in transcript of the gene. Having identified alleles of a gene that are expressed at different levels, the alleles can be further analyzed to locate a second polymorphism that has a causative role in the different expression levels. The methods are amenable to analyzing large collections of genes simultaneously using arrays of immobilized probes.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.
